Flashing Insulator seals the roof opening and prevents condensation forming on the flashing interior from exposure to humid air in unventilated spaces.

Step 1: Center Flashing Insulator to under side of flashing. Align the edges so that it lines up with the flashing edges (**Diagram A**).

Step 2: Remove backing from the eight (8) pieces of tape one by one and bond the Flashing Insulator to the flashing. The tape should overlap the Flashing Insulator approximately 2 in (50 mm) (**Diagram B**).

Step 3: Follow regular flashing installation instructions. Carefully insert tube through flashing insulator (**Diagram C**).

Note: Solatube Models 21-O and 21-C Flashing Insulator is applied in similar fashion, but flashing shape is round.

**Solatube Models
21-O and 21-C**

Warning: Do not expose Flashing Insulator to direct flame.
